DETAILED ACTION

Response to Amendment

1. The Applicant's Amendments and Accompanying Remarks, filed July 15, 2004, have been entered and have been carefully considered. Claims 11 – 15 are withdrawn and claims 1 – 15 are pending. In view of Applicant's 1.131 Declaration which establishes reduction to practice of the invention at a date prior to December 22, 2000, which is the effective date of Wertz, the Examiner withdraws the previously set forth rejection as detailed in paragraph 3 of the Office Action dated April 21, 2004. Despite this advance, the invention as currently claimed is not found to be patentable for reasons herein below.

2. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

Claim Rejections - 35 USC § 103

3. Claims 1 – 10 are rejected under 35 U.S.C. 103(a) as being unpatentable over Gruber (US 4,195,008).

Gruber is directed to a latex extended with grafted mineral oil (Title).

Gruber teaches a latex adhesive which can be applied to the back of any woven or nonwoven carpet (column 5, lines 30 – 40 and column 5, lines 65 – 69). The latex is a water-based system of copolymers such as styrene-butadiene copolymer (column 6, lines 1 - 5). The copolymers may be prepared in an aqueous emulsion system using conventional short stop agents (column 6, lines 30 – 40). Gruber additionally teaches that carboxylated butadiene-styrene

Art Unit: 1771

copolymer can be used as the copolymer and can be cross-linked with cross-linking agents such as urea-formaldehyde resin (column 7, lines 5 – 10). Gruber teaches that the yarns or tufts of the carpet can be made of polyester (column 5, lines 50 – 60) as well as the secondary backing (column 7, lines 40 – 50).

As to claims 1 – 10, Gruber discloses the claimed invention except for that the binder comprises at least 10 – 90 wt% styrene-butadiene and a corresponding amount of 90 – 10 wt% of urea-formaldehyde resin as required by claims 1 and 6, about 70 wt% styrene-butadiene and about 30 wt% of urea-formaldehyde resin as required by claims 2 and 7, at least 10 – 90 wt% styrene and 90 – 10 wt% butadiene as required by claims 3 and 8, about 30 - 70 wt% styrene and about 70 – 30 wt% of styrene as required by claims 4 and 9 and about 40 wt% styrene and about 60 wt% of styrene as required by claims 5 and 10. It should be noted that the amount of styrene-butadiene and urea-formaldehyde resin present in the binder and the proportion of butadiene to styrene are result effective variables. For example, as the styrene content increases, the binder becomes stiffer and is more impact resistant. It would have been obvious to one having ordinary skill in the art at the time the invention was made to create a binder with 10 – 90 wt% styrene-butadiene and a corresponding amount of 90 – 10 wt% of urea-formaldehyde resin as required by claims 1 and 6, about 70 wt% styrene-butadiene and about 30 wt% of urea-formaldehyde resin as required by claims 2 and 7, at least 10 – 90 wt% styrene and 90 – 10 wt% butadiene as required by claims 3 and 8, about 30 - 70 wt% styrene and about 70 – 30 wt% of styrene as required by claims 4 and 9 and about 40 wt% styrene and about 60 wt% of styrene as required by claims 5 and 10 since it has been held that discovering an optimum value of a result effective variable involves only routine skill in the art. *In re Boesch*, 617 F.2d 272, 205 USPQ 215 (CCPA 1980).

In the present invention, one would have been motivated to optimize the ratio of styrene-butadiene and urea-formaldehyde and the ratio of styrene to butadiene to create a binder with proper tear strength and impact strength.

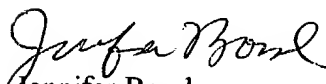

Response to Arguments

4. Applicant's arguments with respect to claims 1 – 10 have been considered but are moot in view of the new ground(s) of rejection.
